

ABSTRACT

The systems and process of identification and information through one fixed application or series of applications tied to an identification card. Encoded with all pertinent information including fingerprint and biometric information data. A photo identity would be read at check points throughout terminals of transit and checkpoints, such as borders, airport federal screening points, ports of entry and exit. Cards are read and verified and validated via databases and biometric technology, matching cardholder with card. The card encompasses ticketing, reservations, bag claim, frequent flight account and credit applications: doubles as boarding pass and bag claim. Security checkpoints verify and validate card via federal-local database
